

PYTHON COMBAT

- Atishay Jain
- Gohil Megh Hiteshkumar
- Avadhoot Gorakh Jadhav

Code Editor

- ◆ Used CodeMirror library for code editor
- ◆ Syntax Highlighting using CodeMirror themes, modes, addons
- ◆ Import files to editor using javascript FileReader and functions
- ◆ Autocompletions by adding key-words for functions used and CodeMirror Hints

5 Levels

November 26, 2022

We implemented 5 different levels of battles involving different concepts of python programming:

- 01 **Python Variables**
- 02 **Conditional Statements (if-else)**
- 03 **Loops (for, while)**
- 04 **Functions**
- 05 **Using Lists in Python**

Level 1 Preview

The placements of objects in each level changes on reloading, i.e. Dynamic placements of objects as shown above for level 1

Level Features

- Each level has different Arena
- Proper exceptions handling. If warrior is expected to be going out of arena, then error message is displayed
- **LOGGER:**
 1. Each level has a logger
 2. It displays result of battle to user, that is success/failure
 3. Can be used to print statements as well for debugging
- The instructions of the battle are also present on the level window
- Each level has a tutorial before entering into the battle
- This tutorial is meant to teach some basic concepts that will be used to fight the battle

Extra Features

- **HINTS:**
- Made a Hint Button also that helps user by providing a clue for thinking about the code and solving problem
- **LOGGER:**
- The Logger detects the error in code as well and displays the error also along with success/failure status of user's game
- **SPEED CONTROLLER:**
- Added Speed Controller Buttons that control the movement speed of the warrior, from slow, medium to fast
- **UNIQUE THEME/CONGRATS MESSAGE:**
- The levels are based on a unique storyline and at end of 5th level, a congrats page appears regarding completing the theme story, that leads again to home page

Python in Browser

- ◆ Used Brython Javascript Library for running python
- ◆ Used jQuery for animations of the arena
- ◆ All Python Functions were mapped to JavaScript functions using Brython

Documentation

- ◆ Used Doxygen for documentation of javascript files
- ◆ Extra: Used doxygen-awesome-css theme for more beautiful documentation of Project
- ◆ Modified Doxyfile with js keyword so as to include javascript documentation
- ◆ Report is also produced in latex using Doxygen

Work Distribution

- ◆ Atishay - Code Editor, Tutorial Slides, UI/Frontend, Storyline Theme
- ◆ Megh - Working of arena, Backend, Level 1, Level 2, Level 5, Animations
- ◆ Avadhoot- Arena's Design & Theme, Logger, Backend, Level 3, Level 4

Prolific
Pythonists

Thank You!
